In 1975 my wife and I took a trip from Espanola Ontario to Nova Scotia in our 1965 Mercedes-Benz 230S sedan. The 4 speed manual transmission had just recently been rebuilt by Mercedes-Benz (Canada) and I anticipated no problems with it.

However, being shortly after the trip started I was finding that engaging 1st gear was becoming increasingly difficult to engage. It became so hard to engage that when we reached New Brunswick I could barely get the transmission to shift at all and feared that I would break the shifter rod!

I had heard about Molyslip G [Manual Transmission Supplement] and bought a bottle at a Canadian Tire store and took it to a small country garage to have it installed in the hope that it would at least help alleviate the problem with the transmission.

The transmission began easier to shift almost immediately upon starting out and within 100 miles it was smoother to shift than it had ever been and I was sold on this product.

I typically buy high mileage used cars as my daily drivers and I have used Molyslip [Manual Transmission Supplement] in the manual transmission, power steering and differential of every car that I have owned since and have yet to have a transmission, power steering or differential fail in all this time. It is an outstanding product in my opinion.
