SUBJECT: "COPASLIP" ANTI-SEIZE COMPOUND

TCI would like to introduce the addition of "Copaslip" Anti-Seize Compound to our fine line of chemicals and service-related products. "Copaslip" is an anti-seize compound consisting of finely divided metallic lead and micro-sized particles of copper in a non-melt bentone grease base.

"Copaslip", by its unique combination of properties, ensures rapid and easy assembly of threaded parts; reduces torque, prevents seizing and galling, reduces wear in areas of friction and can be used in high temperature areas (up to 2000^of.)

"Copaslip" can be used in the following areas:

- Behind disc brake pads to prevent squeel.
- At pivot points and adjusters on drum brakes to facilitate adjustments.
- Exhaust systems - use between manifold, pipes and mufflers for removal without distortion or damage.
- Excellent for spark plug threads and cylinder head bolts to reduce torque by eliminating thread interference.

"Copaslip" is now in stock and can be ordered through your respective parts distribution centre under the following part number:

Part Number	Description	Dealer Net	Sugg. List
00050-03471	"Copaslip" Anti-Seize Compound. 2 oz. tube		

NOTE: Must be ordered in multiples of 24
